Cursor Agent Transcript — Math Practice App

Complete readable conversion of the uploaded JSONL file, in original record order. Includes user and assistant text, tool calls and any tool results contained in the export. Text marked [REDACTED] was already redacted in the source.

1. USER

<timestamp>Tuesday, Jul 28, 2026, 10:46 PM (UTC-4)</timestamp>

<user_query>

Use the Software specification @specification.md and the todo list @TODO.md to complete Phase 1. Mark items as done in the todo list.

</user_query>

2. ASSISTANT

I'll read the specification and TODO list to identify Phase 1 scope, then explore the codebase and implement what's required.

[REDACTED]

TOOL CALL: Read {"path": "/Users/wei.wei/Dropbox/math-practice/TODO.md"}

TOOL CALL: Read {"path": "/Users/wei.wei/Dropbox/math-practice/specification.md", "limit": 200}

TOOL CALL: Glob {"glob_pattern": "**/*", "target_directory": "/Users/wei.wei/Dropbox/math-practice"}

3. ASSISTANT

The repo only has docs so far — I'll read the spec's type definitions, then scaffold the Vite React project and Phase 1 setup.

[REDACTED]

TOOL CALL: Grep {"pattern": "MathOperation|DifficultyLevel|Question|PracticeAttempt|PracticeSession|MistakePattern|AppSettings|interface|type", "path": "/Users/wei.wei/Dropbox/math-practice/specification.md"}

TOOL CALL: Read {"offset": 200, "limit": 400, "path": "/Users/wei.wei/Dropbox/math-practice/specification.md"}

4. ASSISTANT

[REDACTED]

TOOL CALL: Read {"limit": 250, "offset": 600, "path": "/Users/wei.wei/Dropbox/math-practice/specification.md"}

TOOL CALL: Read {"limit": 150, "offset": 900, "path": "/Users/wei.wei/Dropbox/math-practice/specification.md"}

5. ASSISTANT

[REDACTED]

TOOL CALL: Grep {"path": "/Users/wei.wei/Dropbox/math-practice/specification.md", "pattern": "AppSettings|SessionLength|ReviewMode", "-A": 15}

6. ASSISTANT

Creating the Vite React TypeScript project at the workspace root and setting up Phase 1.

[REDACTED]

TOOL CALL: Shell {"command": "cd /Users/wei.wei/Dropbox/math-practice && npm create vite@latest . -- --template react-ts 2>&1", "description": "Create Vite React TypeScript project", "required_permissions": ["full_network"]}

7. ASSISTANT

Latest create-vite needs Node 20+ — trying an older version compatible with Node 18.

[REDACTED]

TOOL CALL: Shell {"command": "cd /Users/wei.wei/Dropbox/math-practice && npm create vite@5.4.11 math-practice-app -- --template react-ts 2>&1", "description": "Create Vite project with Node 18 compatible version", "required_permissions": ["full_network"]}

8. ASSISTANT

[REDACTED]

TOOL CALL: Shell {"command": "npm view create-vite versions --json 2>&1 | tail -20", "description": "List available create-vite versions", "required_permissions": ["full_network"]}

9. ASSISTANT

[REDACTED]

TOOL CALL: Shell {"command": "cd /Users/wei.wei/Dropbox/math-practice && npm create vite@7.1.3 math-practice-app -- --template react-ts 2>&1", "description": "Create Vite project with create-vite 7.x", "required_permissions": ["full_network"]}

10. ASSISTANT

[REDACTED]

TOOL CALL: Glob {"glob_pattern": "**/*", "target_directory": "/Users/wei.wei/Dropbox/math-practice/math-practice-app"}

TOOL CALL: Read {"path": "/Users/wei.wei/Dropbox/math-practice/math-practice-app/package.json"}

11. ASSISTANT

[REDACTED]

TOOL CALL: Read {"path": "/Users/wei.wei/Dropbox/math-practice/math-practice-app/vite.config.ts"}

TOOL CALL: Read {"path": "/Users/wei.wei/Dropbox/math-practice/math-practice-app/eslint.config.js"}

TOOL CALL: Read {"path": "/Users/wei.wei/Dropbox/math-practice/math-practice-app/tsconfig.app.json"}

TOOL CALL: Read {"path": "/Users/wei.wei/Dropbox/math-practice/math-practice-app/src/App.tsx"}

12. ASSISTANT

[REDACTED]

TOOL CALL: Shell {"command": "cd /Users/wei.wei/Dropbox/math-practice/math-practice-app && npm install && npm install -D prettier eslint-config-prettier vitest jsdom @testing-library/react @testing-library/jest-dom @testing-library/user-event 2>&1", "description": "Install project and dev dependencies", "required_permissions": ["full_network"], "block_until_ms": 120000}

13. ASSISTANT

Creating project structure, types, and tooling configuration.

[REDACTED]

22. ASSISTANT

Phase 1 is complete. The React app lives in `math-practice-app/`, and all Phase 1 items in `TODO.md` are marked done.

What was built

1. React + Vite + TypeScript project

- Scaffolded with Vite (`react-ts` template) in `math-practice-app/`
- Default Vite demo content removed
- Minimal app shell with `AppTitle` and welcome message
- Folder structure aligned with the spec:

```text
src/
├── app/
├── components/{common,layout,practice,statistics}/
├── pages/
├── services/
├── hooks/
├── types/
├── utils/
└── test/
```

2. Development tooling

- **ESLint** — existing config extended with `eslint-config-prettier`
- **Prettier** — `.prettierrc` and format scripts
- **Vitest + React Testing Library** — configured in `vite.config.ts`
- **Basic test** — `AppTitle.test.tsx` (2 tests, passing)

Scripts added: `test`, `test:watch`, `format`, `format:check`

3. Shared TypeScript types

Per the specification:

File	Types
`types/question.ts`	`MathOperation`, `DifficultyLevel`, `Question`
`types/session.ts`	`PracticeAttempt`, `PracticeSession`, `SessionLength`, `ReviewMode`
`types/mistake.ts`	`MistakePattern`
`types/statistics.ts`	`OperationStatistics`, `AppStatistics` + empty-state helpers
`types/settings.ts`	`AppSettings`, `DEFAULT_APP_SETTINGS`

Verified

- `npm run test` — 2 tests pass
- `npm run lint` — clean
- `npm run build` — succeeds
- `npm run dev` — runs at http://localhost:5173

Note: Vite was pinned to **5.4.11** because the environment uses Node 18; Vite 7 requires Node 20+.

Next steps

To start the app:

```bash
cd math-practice-app
npm run dev
```

Phase 2 (Basic Interface) is next: shared page layout, home page, and routing. Say if you want to continue with that.

[REDACTED]

23. USER

<timestamp>Tuesday, Jul 28, 2026, 10:51 PM (UTC-4)</timestamp>

<user_query>

The UI looks very plain. Can you improve the UI so that it is attractive to children from 7-12 years old?

</user_query>

24. ASSISTANT

I'll review the current UI and spec, then apply a brighter, child-friendly design.

28. ASSISTANT

The home screen is now built for kids 7–12: bright colors, friendly typography, and a layout that’s easy to tap on tablets.

Visual design

- **Colorful gradient background** — soft sky blue, sunny yellow, and pink tones

- **Playful fonts** — [Fredoka](https://fonts.google.com/specimen/Fredoka) for headings, [Nunito](https://fonts.google.com/specimen/Nunito) for body text

- **Floating decorations** — gentle animated shapes and faint math symbols (+, ×, ÷) in the background

- **Gradient title** with operation badges (+ − × ÷) and an “Ages 7–12” label

Home page layout

- **Hero card** — white card with shadow, calculator mascot, and encouraging copy (“Ready to become a math star?”)

- **Three large action buttons** — color-coded with icons:

- Start Practice (blue)

- View Statistics (gold)

- Settings (purple)

- **Helpful tip** at the bottom to guide new users

Reusable components (ready for Phase 2)

| Component | Purpose |

|-----------|---------|

| `Button` | Large, rounded, 3D-style buttons with variants |

| `PageContainer` | Centered layout with background decorations |

| `AppTitle` | Branded header with math symbols |

| `HomePage` | Full welcome screen |

Accessibility

- Large touch targets (52px+ button height)

- Visible focus outlines for keyboard users

- Animations respect `prefers-reduced-motion`

- Semantic HTML with proper headings and nav labels

Run `npm run dev` in `math-practice-app` to preview. The buttons are styled but not wired to routes yet — that comes in Phase 2 when we add React Router.

32. ASSISTANT

[REDACTED]

TOOL CALL: Shell {"command": "kill 27267 2>/dev/null || true", "description": "Stop background dev server"}

33. ASSISTANT

The error happened because `npm run dev` was run from `/Users/wei.wei/Dropbox/math-practice`, but the app and its `package.json` live in the `math-practice-app/` subfolder.

I added a root `package.json` that forwards scripts to the app, so you can run everything from the project root:

```bash
npm run dev
```

That starts the dev server (usually at http://localhost:5173).

You can also run from the app folder directly:

```bash
cd math-practice-app
npm run dev
```

If dependencies aren't installed yet, run once from the root:

```bash
```

npm run install:app
```

## 37. ASSISTANT

[REDACTED]

> TOOL CALL: Shell {"command": "cd /Users/wei.wei/Dropbox/math-practice && git status && echo \"---\" && git check-ignore -v math-practice-app/node_modules math-practice-app/dist 2>&1", "description": "Verify git status and ignore rules"}

## 38. ASSISTANT

Git is set up for the project. Here’s what was in place and what was added:

## Already present

- Git repository initialized on branch `main` (no commits yet)

## Added

- **Root `.gitignore`** — ignores `node_modules/`, `dist/`, logs, coverage, env files, editor/OS junk, and build caches
- **Root `README.md`** — repo layout and how to run the app from the project root
```

`node_modules` and `dist` are correctly excluded from tracking.

Track your files

When you’re ready for the first commit:

```bash
cd /Users/wei.wei/Dropbox/math-practice
git add .
git commit -m "Initial commit: Math Practice app scaffold"
```

If you want, I can create that initial commit for you.

</user_query>

40. ASSISTANT

Git needs a name and email before it can create commits. I can't set that for you (project policy: no git config changes). Checking whether anything is already configured:

[REDACTED]

> TOOL CALL: Shell {"command": "cd /Users/wei.wei/Dropbox/math-practice && git config user.name 2>&1; git config user.email 2>&1; git config --global user.name 2>&1; git config --global user.email 2>&1", "description": "Check existing git user identity config"}

41. ASSISTANT

Git doesn't have your name or email yet, so the commit was rejected. Set them once, then commit again.

Option A — for all repos on this machine (usual choice):

```bash
git config --global user.name "Your Name"
git config --global user.email "you@example.com"
```

Option B — only for this project:

```bash
cd /Users/wei.wei/Dropbox/math-practice
git config user.name "Your Name"
git config user.email "you@example.com"
```

Use your real name and the email tied to GitHub (if you use it).

Then commit:

```bash
git commit -m "Initial commit: Math Practice app scaffold"
```

(`git add .` was already run, so you shouldn't need to add again unless you've changed files since.)

If you share the name and email you want on commits, I can run the commit using one-off flags (without saving config).

edby=\"home-welcome\">\n <AppTitle />\n <div className=\"home-page__mascot\" aria-hidden=\"true\">\n \n \n <h2 id=\"home-welcome\" className=\"home-page__welcome\">\n Ready to become a math star?\n </h2>\n <p className=\"home-page__message\">\n {getWelcomeSubtitle(settings)} — practice addition, subtraction,\n multiplication, and division with fun flashcards. Flip the card, check\n your answer, and track your progress!\n </p>\n </section>", "path": "/Users/wei.wei/Dropbox/math-practice/math-practice-app/src/pages/HomePage.tsx"}

TOOL CALL: Shell {"command": "cd /Users/wei.wei/Dropbox/math-practice/math-practice-app && npm run build 2>&1", "description": "Verify build passes with runtime bug"}

47. ASSISTANT

Introduced a runtime bug in `HomePage.tsx`.

What breaks: On load, the home page calls `getWelcomeSubtitle(settings)` with `settings` set to `undefined` (hidden behind a type cast). That throws:

```text
TypeError: Cannot read properties of undefined (reading 'defaultDifficulty')
```

React shows a blank screen / error overlay instead of the welcome page.

Where: `math-practice-app/src/pages/HomePage.tsx` — the `settings` variable and `getWelcomeSubtitle()` call.

Note: The build still succeeds; the failure only happens in the browser when the page renders.

To fix: Use the real default settings, e.g.:

```ts
const settings = DEFAULT_APP_SETTINGS;
```

Or add a null check before reading `settings.defaultDifficulty`.

Reload the dev server to see the crash. Say if you want me to fix it or add a second bug somewhere else.

<user_query>

discard any git changes

</user_query>

49. ASSISTANT

[REDACTED]

TOOL CALL: Shell {"command": "cd /Users/wei.wei/Dropbox/math-practice && git status && git diff --stat", "description": "Check git status and changed files"}

50. ASSISTANT

[REDACTED]

TOOL CALL: Shell {"command": "cd /Users/wei.wei/Dropbox/math-practice && git restore . && git status", "description": "Discard all uncommitted git changes", "required_permissions": ["git_write"]}

51. ASSISTANT

All uncommitted changes are discarded. The working tree is clean again.

The intentional bug in `math-practice-app/src/pages/HomePage.tsx` was reverted, so the home page should load normally after a browser refresh.

64. ASSISTANT

Phase 2 is complete. Several items were already in place from the earlier UI work; routing and layout pieces were added to finish the phase. All Phase 2 tasks in `TODO.md` are checked off.

Already done (from UI work)

- **PageContainer** — centered layout with background decorations
- **AppTitle** — gradient title with math symbols
- **Button** — large, child-friendly styled buttons
- **HomePage** — welcome message and three action buttons
- **Responsive spacing & fonts** — design tokens in `variables.css`

Added for Phase 2

Shared layout

- **`Header`** — logo + “Math Practice” title linking home
- **`Navigation`** — pill-style nav with active route highlighting
- **`AppLayout`** — wraps every page with header, nav, and main content

Routing (`react-router-dom`)

Route	Page
`/`	Home
`/practice/setup`	Practice setup (placeholder)
`/practice/session`	Practice session (placeholder)
`/practice/summary`	Session summary (placeholder)
`/statistics`	Statistics (placeholder)
`/settings`	Settings (placeholder)
`*`	Not found fallback

Other

- **`ButtonLink`** — same look as `Button`, but uses router links (keyboard accessible)
- **`PageCard`** — reusable card for placeholder pages
- **Tests** — HomePage, Navigation, and AppRoutes (8 tests passing)

Refresh the dev server and try the home buttons or top nav — each route should load its placeholder page. Phase 3 (operation/difficulty/session selectors on the setup page) is next when you’re ready.

77. ASSISTANT

Phase 3 is complete. All items in `TODO.md` are checked off. Here’s what was built:

Phase 3 Summary

Operation Selector (`OperationSelector.tsx`)

- Toggle buttons for **+ − × ÷**

- Multi-select support

- **Select All Operations** shortcut (mixed practice)

- Selected state styling + `aria-pressed` for keyboard access

Difficulty Selector (`DifficultySelector.tsx`)

- **Beginner, Easy, Intermediate, Advanced** (levels 1–4)

- Single-select radio group

- Short child-friendly description for each level

Session Length Selector (`SessionLengthSelector.tsx`)

- **5, 10, 20 questions** and **Continuous practice**

- Default: **10 questions** (from `DEFAULT_APP_SETTINGS`)

Practice Setup Page

- Combines all three selectors on `/practice/setup`
- **Start Session** button (disabled when no operations selected)
- Validation alert when no operations are selected
- Passes config to `/practice/session` via router state

Practice Session Page

- Reads and validates setup config
- Redirects to setup if config is missing or invalid
- Shows a summary of chosen options (questions come in Phase 4+)

Try it

1. Go to **Practice** → `/practice/setup`
2. Choose operations, difficulty, and session length
3. Click **Start Session** → see your config on the session page

21 tests passing — including selector components, setup flow, and config validation.

TOOL CALL: Shell {"command": "cd /Users/wei.wei/Dropbox/math-practice/math-practice-app && npm run lint 2>&1", "description": "Verify lint is clean"}

88. ASSISTANT

Phase 4 is complete. All Phase 4 items in `TODO.md` are checked off.

What was built

Utilities (`src/utils/`)

| File | Purpose |

|------|---------|

| `math.ts` | `randomInt(min, max)` — inclusive random integers |

| `shuffle.ts` | Fisher–Yates array shuffle |

| `ids.ts` | `createId()` for unique question IDs |

| `validation.ts` | `validateQuestion()` — operands, answers, 4 unique choices, difficulty rules |

Difficulty rules (`src/services/difficultyRules.ts`)

Rules from the spec for all 4 levels:

- **Addition** — operand ranges + max sum (levels 1–2)

- **Subtraction** — no negatives (levels 1–3); optional negatives at Advanced

- **Multiplication** — factor ranges per level (including 1d×2d and 2d×2d)

- **Division** — divisor/quotient approach, no divide-by-zero, dividend caps

Operation generators (`src/services/generators/`)

- `addition.ts`, `subtraction.ts`, `multiplication.ts`, `division.ts`

- Each returns a full `Question` with `displayText` (e.g. `7 × 8 = ?`)

- Division uses **divisor × quotient = dividend** (whole-number answers only)

Main generator (`src/services/questionGenerator.ts`)

- `generateQuestion(operation, difficulty)`

- `generateQuestionFromOperations(operations, difficulty)` — random operation from selected set

- Validation + retry on failure

Practice session integration

`/practice/session` now shows a **sample generated question** with 4 placeholder answer choices and a **Generate Another Question** button.

> Placeholder choices are temporary; Phase 5 adds proper distractors.

Tests

40 tests passing, including:

- All 3 utilities

- Each operation generator

- All operations × all difficulty levels

- Mixed-operation selection

- End-to-end setup → session flow

Try it

1. **Practice Setup** → choose options → **Start Session**

2. View the generated question and click **Generate Another Question**

Phase 5 (plausible incorrect answer choices and shuffling) is next.

98. ASSISTANT

Phase 5 is complete. All Phase 5 items in `TODO.md` are checked off.

What was built

`distractorGenerator.ts`

New service that builds four multiple-choice answers with:

| Feature | Implementation |

|---------|----------------|

| **3 incorrect answers** | Selected from a pool of plausible distractors |

| **Uniqueness** | All 4 choices unique; correct answer appears exactly once |

| **Whole numbers only** | `Number.isInteger()` validation |

| **No negative distractors** | When `allowNegativeChoices` is false |

| **Retry limit** | Up to 25 attempts with expanding fallback offsets |

Operation-specific distractors

- **All operations** — nearby values (±1, ±2, ±3, ±4)

- **Addition** — off-by-one sums, operand-adjusted mistakes (e.g. `(a+1)+b`)

- **Subtraction** — added-instead-of-subtracted (`a+b`), adjusted operands

- **Multiplication** — table neighbors (`a×(b±1)`), `(a±1)×b`, add-instead-of-multiply

- **Division** — quotient ±1, divisor confusion, alternate divisors, fact-family errors

Shuffling

- Correct answer + 3 distractors combined and shuffled via Fisher–Yates

- Correct answer position varies across generations (tested)

Integration

- Replaced `buildPlaceholderChoices` in `shared.ts` with `generateChoices()`

- Practice session page now shows **realistic distractors** for each generated question

Tests

50 tests passing, including 10 new distractor tests covering:

- Uniqueness and correctness rules

- Each operation’s distractor strategies

- Edge cases near zero (0+2, 5−5, 0×9, 0÷4)

- Shuffle randomness

- Retry limit constant

Try it: start a practice session and click **Generate Another Question** — you should see plausible wrong answers (e.g. for `8 × 7 = ?`, choices like 48, 54, 56, 64).

Phase 6 (interactive question card with answer selection and flip) is next.

111. ASSISTANT

Phase 6 is complete. All Phase 6 items in `TODO.md` are checked off.

What was built

Components (`src/components/practice/`)

Component	Purpose
AnswerChoice	Large tappable button with selected/hover/focus states, `aria-label`, disabled after flip
CardFront	Question text, “Question X of Y”, 4 choices, **Flip Card** (disabled until an answer is picked)
CardBack	Solved equation, your answer, **I Got It Right** / **I Got It Wrong**
QuestionCard	Manages selection, flip state, and result recording

Card behavior

1. Pick an answer → it highlights; flip button enables
2. **Flip Card** → back shows the correct answer and your choice
3. **I Got It Right** or **I Got It Wrong** → records once, then loads the next question

State resets on each new question via `key={question.id}`.

Flip animation

- **3D CSS flip** when animations are on (`DEFAULT_APP_SETTINGS.cardAnimationEnabled`)
- **Instant swap** when animations are off or `prefers-reduced-motion` is set
- `backface-visibility: hidden` keeps text readable during the flip

Practice page

`/practice/session` now uses the full interactive question card instead of the static preview.

Try it

1. Start a session from **Practice Setup**
2. Select an answer → **Flip Card**
3. Tap **I Got It Right** or **I Got It Wrong** → next question loads

56 tests passing. Phase 7 adds full session flow (progress bar, session totals, completion, summary page).

TOOL CALL: Shell {"command": "cd /Users/wei.wei/Dropbox/math-practice/math-practice-app && npm run build 2>&1", "description": "Verify TypeScript build passes"}

130. ASSISTANT

[REDACTED]

TOOL CALL: Read {"limit": 30, "offset": 250, "path": "/Users/wei.wei/Dropbox/math-practice/TODO.md"}

131. ASSISTANT

Phase 7 is implemented and all Phase 7 items (26–31) are checked off in `TODO.md`. All **61 tests pass**, and lint/build succeed.

What was built

Session state (`usePracticeSession` hook)

- Reducer-based session management: ID, operations, difficulty, length, question index, correct/incorrect counts, attempts, active flag

- Records self-reported results and stores full `PracticeAttempt` records

- Generates the next question while avoiding immediate repeats via question signatures

- Short transition between questions (~180ms)

- Auto-navigates to `/practice/summary` when a fixed session completes or the user ends continuous practice

Practice page

- Reads setup config from router state; redirects to setup if invalid

- Shows `QuestionCard` with progress and session flow wired end-to-end

- Fixed-length sessions show an accessible `ProgressBar`

- Continuous sessions show an **End Session** button with confirmation dialog

Session summary

- Basic summary page showing attempted/correct/incorrect/accuracy plus session config

- **Practice Again** and **Return Home** actions

Supporting pieces

- `ProgressBar`, `ConfirmDialog`, `questionSignature` utility, `SessionSummaryState` types

- `QuestionCard.onResult` now passes `(selfReportedCorrect, selectedAnswer)`

- Tests for the hook, progress bar, and unique question generation

You can try it by starting a practice session from setup — fixed sessions end at the summary automatically; continuous sessions use **End Session** to finish.

144. ASSISTANT

Phase 8 is implemented and all Phase 8 items (32–34) are checked off in `TODO.md`. **69 tests pass**, and lint/build succeed.

Task 32 — Detect Session Completion

- Extracted `isFixedSessionComplete()` into `src/utils/sessionCompletion.ts` with unit tests
- Session hook already stops question generation, saves `completedAt`, and navigates to `/practice/summary`
- Added a navigation test when a fixed-length session finishes

Task 33 — Session Summary Page

Enhanced `SessionSummaryPage` to show:

- Attempted, correct, incorrect, and accuracy
- Mistake-review question count (from attempts with `source: 'mistake-review'`)
- Operations, difficulty, and session length in a details panel

Task 34 — Summary Actions

All five actions are present:

- **Practice Again** — restarts with the same config via router state
- **Practice Mistakes** — shown disabled with help text until mistake storage exists (Phase 14)
- **Change Settings** — links to `/practice/setup`
- **View Statistics** — links to `/statistics`
- **Return Home** — links to `/`

New helpers

- `countMistakeReviewAttempts()`, `sessionToPracticeSetup()` in `sessionSummary.ts`
- `canStartMistakeReview()` stub in `mistakeReviewAvailability.ts` (returns false until persistence is added)

Complete a practice session to see the full summary page with stats and action buttons.

162. ASSISTANT

Phase 9 is implemented and all Phase 9 items (35–39) are checked off in `TODO.md`. **85 tests pass**, and lint/build succeed.

Storage layer (`src/services/storage/`)

- **`storageService.ts`** — localStorage wrapper with read/write, JSON parsing, unavailable storage, and quota handling

- **`validators.ts`** — validates/sanitizes settings, sessions, and attempts

- **`migrations/`** — schema versioning (v1) with migration runner that preserves unrelated data

- **`practiceDataStore.ts`** — high-level API for settings, sessions, and attempts (with limits: 100 sessions, 5000 attempts)

App integration

- **`AppSettingsProvider`** — loads settings on startup, auto-saves changes, surfaces storage warnings

- **`SettingsPage`** — functional settings UI (preferences + practice defaults)

- **`PracticeSetupPage`** / **`PracticePage`** — use persisted settings for defaults and card animation

- **`usePracticeSession`** — saves each attempt immediately and the completed session at end

- **`StorageWarningBanner`** — friendly alert when storage fails

Persistence behavior

- Settings survive reloads; invalid data falls back to safe defaults

- Attempts include selected answer, self-reported result, operation, difficulty, session ID, and timestamp

- Sessions save completion details when a practice session ends

- Data reloads from localStorage after a browser restart (covered by tests)

You can verify by completing a practice session, refreshing the page, and checking Settings — changes persist across reloads.

TOOL CALL: Shell {"command": "cd /Users/wei.wei/Dropbox/math-practice/math-practice-app && npm run lint 2>&1", "description": "Verify lint passes"}

175. ASSISTANT

Phase 10 is implemented and all Phase 10 items (40–47) are checked off in `TODO.md`. **93 tests pass**, and lint/build succeed.

Statistics calculations (`statisticsService.ts`)

- Computes overall totals and accuracy from stored attempts

- Tracks stats by operation (addition, subtraction, multiplication, division)

- Tracks stats by difficulty (levels 1–4)

- Handles zero attempts safely (0% accuracy, no divide-by-zero)

- Unit tests included

Statistics page (`StatisticsPage.tsx`)

- **Overall overview** — attempted, correct, incorrect, accuracy, with empty state

- **By operation** — responsive card grid for each operation

- **By difficulty** — labeled cards for each level

- **Recent sessions** — newest first, with date, operations, difficulty, totals, and accuracy

- **Reset statistics** — confirmation dialog; clears attempts, sessions, and cached statistics while **keeping settings unchanged**

Supporting pieces

- `useStatistics` hook — loads data from storage and refreshes after reset

- `clearPracticeHistory()` in `practiceDataStore` — clears history without touching settings

- Reusable components: `StatisticsOverview`, `StatisticsCard`, `OperationStatisticsSection`, `DifficultyStatisticsSection`, `RecentSessionsList`

Complete a practice session, then open **Statistics** from the home page or nav to see your progress. Use **Reset Statistics** to clear history when needed.

TOOL CALL: Shell {"command": "cd /Users/wei.wei/Dropbox/math-practice/math-practice-app && npm run test -- src/pages/StatisticsPage.test.tsx 2>&1", "description": "Run statistics page tests"}

181. ASSISTANT

The statistics metric boxes were too cramped because four columns were squeezed into each operation/difficulty card on medium screens.

Here’s what changed:

- **Operation & difficulty cards** — metrics stay in a **2×2 grid** (no more four-in-a-row), with larger padding, minimum height, and readable label size

- **Overall overview** — wider cells with more padding; four columns only on screens **768px+**

- **Recent sessions** — larger stat boxes; stacked on very small screens

- **Labels** — removed uppercase/letter-spacing so “Attempted”, “Correct”, etc. fit naturally

Refresh the statistics page and the labels should display cleanly. If anything still feels tight on your screen size, say which section and we can tune it further.

TOOL CALL: Read {"path": "/Users/wei.wei/Dropbox/math-practice/math-practice-app/src/components/layout/PageContainer.css"}

184. ASSISTANT

The four-column layout at 768px exceeds the page's 42rem max width. Keeping the overview at a 2×2 grid and ensuring the grid stays within its container.

[REDACTED]

TOOL CALL: StrReplace {"new_string": ".statistics-overview {\n display: flex;\n flex-direction: column;\n gap: var(--space-md);\n width: 100%;\n min-width: 0;\n padding: var(--space-xl);\n border-radius: var(--radius-xl);\n background: var(--color-surface);\n box-shadow: var(--shadow-lift);\n box-sizing: border-box;\n}", "old_string": ".statistics-overview {\n display: flex;\n flex-direction: column;\n gap: var(--space-md);\n padding: var(--space-xl);\n border-radius: var(--radius-xl);\n background: var(--color-surface);\n box-shadow: var(--shadow-lift);\n}", "path": "/Users/wei.wei/Dropbox/math-practice/math-practice-app/src/components/statistics/StatisticsOverview.css"}

TOOL CALL: StrReplace {"new_string": ".statistics-overview__stats {\n display: grid;\n grid-template-columns: repeat(2, minmax(0, 1fr));\n gap: var(--space-md);\n width: 100%;\n min-width: 0;\n margin: 0;\n padding: 0;\n list-style: none;\n}\n\n.statistics-overview__stat {\n display: flex;\n flex-direction: column;\n justify-content: center;\n gap: var(--space-sm);\n min-width: 0;\n min-height: 6rem;\n padding: var(--space-lg);\n border-radius: var(--radius-lg);\n background: var(--color-surface-muted);\n text-align: center;\n box-sizing: border-box;\n}", "old_string": ".statistics-overview__stats {\n display: grid;\n grid-template-columns: repeat(2, minmax(8rem, 1fr));\n gap: var(--space-md);\n margin: 0;\n padding: 0;\n list-style: none;\n}\n\n.statistics-overview__stat {\n display: flex;\n flex-direction: column;\n justify-content: center;\n gap: var(--space-sm);\n min-height: 6rem;\n padding: var(--space-lg);\n border-radius: var(--radius-lg);\n background: var(--color-surface-muted);\n text-align: center;\n}", "path": "/Users/wei.wei/Dropbox/math-practice/math-practice-app/src/components/statistics/StatisticsOverview.css"}

TOOL CALL: StrReplace {"new_string": ".statistics-overview__stat-value {\n font-family: var(--font-display);\n font-size: var(--text-2xl);\n font-weight: 700;\n line-height: 1.1;\n color: var(--color-text);\n overflow-wrap: anywhere;\n}", "old_string": ".statistics-overview__stat-value {\n font-family: var(--font-display);\n font-size: var(--text-2xl);\n font-weight: 700;\n line-height: 1.1;\n color: var(--color-text);\n}\n\n@media (min-width: 768px) {\n .statistics-overview__stats {\n grid-template-columns: repeat(4, minmax(9rem, 1fr));\n }\n}", "path": "/Users/wei.wei/Dropbox/math-practice/math-practice-app/src/components/statistics/StatisticsOverview.css"}

185. ASSISTANT

The overflow came from a **4-column layout** at 768px+ inside a page capped at **42rem** wide. Four columns with a 9rem minimum each needed more space than the Overall Performance container had, so Accuracy was pushed outside.

Fix: Overall Performance now always uses a **2×2 grid** that fits the page width, with `min-width: 0` and `box-sizing: border-box` so all four stat boxes stay inside the container.

Refresh the statistics page — Attempted, Correct, Incorrect, and Accuracy should all sit fully within Overall Performance.

194. ASSISTANT

The app wasn't loading because **`ButtonLink.tsx` was missing** (deleted accidentally). That broke the build and caused Vite errors in the browser. I restored the file and verified the project builds successfully.

There were also **several old dev servers** running on ports 5173–5176. I started a fresh one here:

http://localhost:5177/

Try that URL first. If you still want to use **http://localhost:5176/**, do a hard refresh (`Cmd+Shift+R`) — it may work now that `ButtonLink.tsx` is back, but that port was tied to the broken session.

To start cleanly from your terminal:

```bash
cd /Users/wei.wei/Dropbox/math-practice
npm run dev
```

Vite will pick the first free port (often 5173). Use the URL printed in the terminal output.

202. ASSISTANT

Phase 11 is implemented and all Phase 11 items (48–50) are checked off in `TODO.md`. **97 tests pass**, and lint/build succeed.

Task 48 — Settings Page

The settings page now includes:

- Sound effects, card animation, and show explanations toggles
- Default operations, difficulty, and session length
- **Mastery threshold** (correct similar answers needed to master a mistake)
- **Auto-save** on every change

Task 49 — Apply Default Practice Settings

- Practice Setup loads saved defaults when you open it
- Setup choices apply **only to the current session** and do not overwrite saved defaults
- A note on the setup page explains this behavior

Task 50 — Clear All Application Data

- **Clear All Application Data** button on Settings
- Strong confirmation dialog (“This action cannot be undone”)
- Clears settings, sessions, attempts, mistake patterns, and statistics

- Restores default settings

- Redirects to the home page after clearing

You can try it under **Settings** — change defaults, use them on Practice Setup, or use **Clear All Application Data** to reset everything.

213. ASSISTANT

Phase 12 is implemented and all Phase 12 items (51–53) are checked off in `TODO.md`. **109 tests pass**, and lint/build succeed.

Mistake pattern creation (Task 51)

When a student marks an answer as incorrect during practice, the app now creates a `MistakePattern` with:

- Operation, operands, correct answer, difficulty

- `lastIncorrectAt` timestamp

- `incorrectCount: 1`, `similarCorrectCount: 0`, `mastered: false`

Updating existing patterns (Task 52)

- Same pattern is detected by exact operation + operands + answer + difficulty (reversed subtraction is **not** treated as the same)

- Repeating a mistake increments `incorrectCount`, updates `lastIncorrectAt`, resets `similarCorrectCount` to 0, and clears `mastered`

Local storage (Task 53)

- Patterns persist under `mathPractice.mistakePatterns`

- Loaded at app startup via `AppSettingsProvider`

- Validated/sanitized on load; invalid records are filtered out

Integration

- `usePracticeSession` records mistakes automatically after incorrect attempts

- `mistakeReviewAvailability` now reads real active (non-mastered) pattern counts from storage

To verify: start a practice session, mark a few answers as **I Got It Wrong**, then check browser DevTools → Application → Local Storage → `mathPractice.mistakePatterns`. Mistake review mode itself comes in Phase 14.

217. ASSISTANT

The dev server started successfully. Ports 5173–5177 were already in use, so Vite picked the next available one.

Use the URL shown in your terminal — right now that’s **http://localhost:5178/** (not 5176).

If 5176 still fails, it’s likely an older dev server on that port. Either use the port from your terminal output, or stop the extra servers and run `npm run dev` again from the project root for a cleaner start (usually on 5173).

TOOL CALL: Read {"path": "/Users/wei.wei/.cursor/projects/Users-wei-wei-Dropbox-math-practice/terminals/82327.txt"}

220. ASSISTANT

`npm run dev` from the repo root works — it forwards to `math-practice-app` and Vite started successfully. Port 5173 was already taken, so that run used **http://localhost:5174/**.

Always use the URL printed in your terminal when you start the server; the port can change if others are already in use.

237. ASSISTANT

Phase 13 is implemented and checked off in `TODO.md`.

Similar Question Generator

New service at `math-practice-app/src/services/similarQuestionGenerator.ts` with three strategies:

1. **Nearby operands** — varies operands by ±1/±2 within the same operation and difficulty. Division uses valid quotient/divisor changes so results stay integer.

2. **Reversed operands** — only for addition and multiplication (not subtraction/division).

3. **Fact family** — inverse operations:

- addition ↔ subtraction

- multiplication ↔ division

`generateSimilarQuestion(pattern, excludeSignatures?)`:

- Accepts a `MistakePattern`

- Randomly picks among applicable strategies

- Validates via existing difficulty rules

- Returns questions with `source: 'mistake-review'` and `mistakePatternId`

- Skips the original pattern and any excluded signatures

Tests

15 unit tests in `similarQuestionGenerator.test.ts` covering all four operations, each strategy, validation, and exclusion logic.

124 tests passing, build succeeds.

Phase 14 (Mistake Review Mode) will wire this into practice setup and review sessions.

274. ASSISTANT

Phase 14 is implemented and checked off in `TODO.md`.

What was added

Practice setup (58)

- New `ReviewModeSelector` on the setup page: **Regular Practice** vs **Mistake Review**
- Mistake review is disabled when there are no active patterns, with an explanation
- Shows the count of active mistake patterns when review mode is selected
- Operation/difficulty selectors are hidden in mistake-review mode

Pattern prioritization (59)
- `mistakePatternPrioritizationService.ts` scores patterns by:
- incorrect count (higher = more priority)
- recency of last mistake
- lower similar-correct count
- random tiebreaker for equal scores

Mistake review sessions (60)
- `mistakeReviewSessionService.ts` selects prioritized patterns and generates similar questions
- `usePracticeSession` supports `reviewMode: 'mistake-review'`
- Questions are tagged with `source: 'mistake-review'` and `mistakePatternId`
- Session summary already shows mistake-review attempt counts; now also shows practice mode

Similar-question tracking (61)
- `recordSimilarQuestionFromAttempt()` updates patterns on review answers
- Correct answers increment `similarCorrectCount`
- Incorrect answers reset progress and increment `incorrectCount`

Mastery rules (62)
- Patterns are marked mastered when `similarCorrectCount >= masteryThreshold` (from settings, default 3)
- Mastered patterns are excluded from active review via `getActiveMistakePatterns()`
- A new mistake on a mastered pattern reactivates it (already supported; now wired through review flow)

140 tests passing, build succeeds.

To try it: make a few mistakes in regular practice, then go to **Practice Setup → Mistake Review** and start a session.

286. ASSISTANT

Phase 15 is implemented and checked off in `TODO.md`.

Advanced Statistics on the Statistics page

Mistake statistics (63)

New **Mistake Review** overview card showing:

- Active mistake patterns

- Mastered patterns

- Similar questions practiced (mistake-review attempts)

- Review questions answered correctly

Frequently missed areas (64)

New **Frequently Missed Areas** section with:

- Most missed operation (supports ties, e.g. "Addition, Subtraction")

- Most missed number facts, sorted by incorrect count

- Empty state: "No saved mistakes yet..."

Mistake details (65)

New **Mistake Details** section with:

- **Active** / **Mastered** tabs to switch views

- Each pattern shows the fact (e.g. `8 − 3 = 5`), incorrect count, mastery progress (`2 / 3`), and last incorrect date

Service layer

`mistakeStatisticsService.ts` handles all calculations, sorting, tie-breaking, and formatting. It is covered by unit tests and wired through `useStatistics`.

145 tests passing, build succeeds.

Open the Statistics page after some practice mistakes to see the new sections.

TOOL CALL: Shell {"command": "cd /Users/wei.wei/Dropbox/math-practice/math-practice-app && npm run build 2>&1", "description": "Verify TypeScript build succeeds"}

305. ASSISTANT

Phase 16 is implemented and checked off in `TODO.md`.

Keyboard navigation (66)

- **`useQuestionCardKeyboard`** — keys `1`–`4` select answer choices
- **`isEditableTarget`** — shortcuts are ignored when focus is in inputs, textareas, selects, or contenteditable fields
- **Focus styles** added for buttons, selector options, settings controls, and answer choices
- Native `<button>` elements support Enter and Space

Screen-reader support (67)

- **`LiveRegion`** — announces question changes, answer selection, and revealed answers
- **`ProgressBar`** — `aria-live="polite"` for session progress updates
- **Semantic HTML** — question text uses `<h2>`, card uses `aria-expanded`
- **Answer choices** — numbered labels (`1.`–`4.`), updated `aria-label`, visible **Selected** badge
- **Icon buttons** — explicit `aria-label` on flip and result buttons (icons stay `aria-hidden`)

Reduced motion (68)

- Existing **`usePrefersReducedMotion`** hook combined with the **Card animation** setting
- Without animation, card faces swap with a clear border instead of flipping
- CSS transitions respect `prefers-reduced-motion`

Visual accessibility (69)

- Selected answers show **number + value + “Selected”** (not color alone)
- Result buttons include **✓** and **✗** icons plus text labels
- **Relative typography** (`rem`, `clamp`) and **`text-size-adjust: 100%`** for zoom and larger system fonts
- Dark text on light surfaces maintained for contrast

153 tests passing, build succeeds.

326. ASSISTANT

Phase 17 is complete. All items in `TODO.md` are checked off, and **158 tests pass** with a successful production build.

Phase 17: Responsive Design and Polish

Tablets & mobile (70–71)

- Large touch targets via `--touch-target-min` in buttons, answer choices, and navigation

- Practice card centered with constrained width (`PracticePage.css`, `QuestionCard.css`)

- Answer choices stack in a single column on small screens (`CardFront.css`)

- No horizontal scroll (`overflow-x: hidden` on page containers)

- Simplified mobile navigation (2×2 grid in `Navigation.css`)

- Tablet/landscape tweaks for choice layout and spacing

Statistics layout (72)

- Metric cards collapse to a single column on small screens (`StatisticsCard.css`, `StatisticsOverview.css`)

- Recent sessions use flexible grid columns and stack stats on mobile (`RecentSessionsList.css`)

- Label/value overlap prevented with `overflow-wrap: anywhere`

Child-friendly feedback (73)

- `practiceFeedbackService.ts` — positive and supportive message pools, randomized selection, no shaming language

- `PracticeFeedback` component shown on the card back after self-report

- Settings toggle: **Encouraging feedback messages** (`feedbackMessagesEnabled`, default on)

- Tests for the feedback service and `QuestionCard` feedback display

Also fixed

- `isEditableTarget.ts` — contenteditable attribute detection for jsdom compatibility

You can try responsive behavior and feedback in the dev server already running; resize the browser or use device emulation to see mobile/tablet layouts and encouraging messages after answering.

3", "content": "Add navigation guard + migrate to data router", "status": "completed"}, {"id": "4", "content": "Update PracticePage,
QuestionCard, tests, TODO.md", "status": "completed"}]}

356. ASSISTANT

Phase 18 is complete. All items in `TODO.md` are checked off, with **169 tests passing** and a successful production build.

Phase 18: Session Recovery and Navigation Safety

74. Persist an Active Session

- Added `ActivePracticeSnapshot` type (`types/activeSession.ts`) — session, current question, attempts, card state (selected answer + flip state)

- Storage via `mathPractice.activeSession` in `practiceDataStore.ts` with validation/sanitization

- `usePracticeSession` saves the snapshot on every state change while active

- `PracticePage` restores from storage on refresh when router state is missing (no setup config in URL state)

- `QuestionCard` supports restoring card state (selected answer, flipped card)

- Active session is cleared when the session finishes

75. Protect Against Accidental Navigation

- Added `usePracticeNavigationGuard` hook using React Router's `useBlocker` for in-app navigation

- Shows a confirmation dialog: **Keep Practicing** or **End Session**

- Registers `beforeunload` while a session is active (browser tab close/refresh warning)

- Guards are disabled once the session completes (`isActive` is false)

- Migrated the app from `BrowserRouter` to `createBrowserRouter` so `useBlocker` works

How to verify

1. Start a practice session, answer a question or select an answer

2. Refresh the page — the session should resume where you left off

3. During an active session, click a nav link (Home, Statistics, etc.) — you should see the leave confirmation

4. Complete or end a session — no more navigation warnings

Try it in your running dev server with a refresh mid-session and a nav click during practice.

TOOL CALL: TodoWrite {"merge": true, "todos": [{"id": "1", "content": "Add storage recovery service (per-category reset)", "status": "completed"}, {"id": "2", "content": "Add question gen fallbacks + dev logging", "status": "completed"}, {"id": "3", "content": "Add ErrorPanel + update pages for missing session", "status": "completed"}, {"id": "4", "content": "Add tests and check off Phase 19 in TODO.md", "status": "completed"}]}

371. ASSISTANT

Phase 19 is complete. All items in `TODO.md` are checked off, with **179 tests passing** and a successful production build.

Phase 19: Error Handling

76. Handle Invalid Stored Data

- Added `storageRecoveryService.ts` — on startup, validates each storage category independently
- Detects and recovers invalid **settings**, **sessions**, **attempts**, **mistake patterns**, and **active sessions**
- Resets only the affected category (e.g. bad attempts don't wipe settings)
- Runs automatically during app initialization via `practiceDataStore`
- Shows a friendly banner when recovery occurs (`getStartupStorageWarning()`)

77. Handle Question-Generation Failures

- `generateQuestion()` validates every result, retries up to **10 times**, then uses a **fallback question**
- Added `fallbackQuestion.ts` with known-good questions per operation
- Added `devLogger.ts` — logs generation failures in development only (no production noise)
- `similarQuestionGenerator` falls back to the original mistake pattern before failing

78. User-Friendly Error Messages

- Added **`ErrorPanel`** component — reusable, accessible (`role="alert"`), no stack traces
- **`SessionSummaryPage`** — explains when summary data is missing, with links to setup and home
- **`PracticePage`** — explains unavailable/restored sessions and mistake-review unavailability
- **`StorageWarningBanner`** — continues to explain storage issues in plain language
- All error states provide a safe path back to **Practice Setup** or **Home**

You can try it by visiting `/practice/session` or `/practice/summary` directly without session state — you should see friendly error panels instead of silent redirects.

397. ASSISTANT

Phase 20 (Testing) is complete. All **213 tests pass** and **`npm run build` succeeds**.

What was implemented

Unit tests (§79)

- Generators, difficulty boundaries, distractors, answer uniqueness

- Statistics, mistake patterns, similar questions, mastery rules

- Storage serialization/validation (`validation.test.ts`, `difficultyRules.test.ts`, `storageSerialization.test.ts`)

Component tests (§80)

- Operation/difficulty selection, answer selection, card flip, right/wrong buttons

- Progress bar updates, session completion, statistics display, confirmation dialogs

Integration tests (§81) — `src/integration/practiceFlows.integration.test.tsx`

- Full addition session, mixed operations, continuous practice
- Mistake creation, review generation, mastery completion
- Persistence after refresh, reset statistics

Accessibility tests (§82) — `src/accessibility/accessibility.test.tsx`

- Keyboard navigation, screen reader labels, reduced motion, zoom layouts
- Automated axe checks (color-contrast disabled in jsdom)

Infrastructure

- `vitest-axe` + `axe-core` for a11y testing
- Shared `MemoryStorage` in `src/test/storageTestUtils.ts`
- Test files excluded from production `tsc` build; `vitest-axe/extend-expect` added to test setup

Build fixes applied

- Corrected integration test helper types (`result.current` ref, not full `RenderHookResult`)
- Excluded test/integration/accessibility files from `tsconfig.app.json` so production builds typecheck only app code

All Phase 20 items in `TODO.md` (lines 772–816) are checked off. Ready for Phase 21 when you are.

407. ASSISTANT

This part **is implemented**. The disabled button and helper text are **intentional** — they show up when there are no active saved mistakes to review yet.

How it works

The **Practice Mistakes** button on the session summary checks stored mistake patterns in local storage, not just what happened in the session you just finished:

```47:47:math-practice-app/src/pages/SessionSummaryPage.tsx
const canPracticeMistakes = canStartMistakeReview();
```

```8:10:math-practice-app/src/services/mistakeReviewAvailability.ts
export function canStartMistakeReview(): boolean {
return getActiveMistakePatternCount() > 0;
}
```

The button is enabled only when you have at least one **active** (not yet mastered) mistake pattern saved.

When mistakes get saved

A mistake pattern is created when, during **regular** practice (not mistake-review mode), you click **“I Got It Wrong”** on the back of the card:

```348:354:math-practice-app/src/hooks/usePracticeSession.ts
} else if (!attempt.selfReportedCorrect) {
const mistakeResult = recordMistakeFromAttempt(attempt);
if (!mistakeResult.success) {
reportStorageError(mistakeResult.error);
}
}
```

Important details:

- Picking the wrong answer choice alone does **not** create a mistake — you must self-report with **“I Got It Wrong”**.
- Clicking **“I Got It Right”** even on a wrong choice counts as correct and does **not** save a mistake.
- If you’ve already mastered all saved mistakes (3 correct similar questions by default), the button stays disabled until you miss something again.

How to see it enabled

1. Start a **regular** practice session (Practice Setup → Regular Practice).
2. Complete at least one question and click **“I Got It Wrong”**.
3. Finish the session and return to the summary — **Practice Mistakes** should be enabled.

You can also confirm mistakes were saved on:

- **Statistics** → “Frequently Missed” section
- **Practice Setup** → **Mistake Review** option (enabled when mistakes exist)

So what you’re seeing is the empty state working as designed, not a missing feature. If you’ve clicked **“I Got It Wrong”** at least once and the button is still disabled, say so — that would point to a bug worth investigating.

427. ASSISTANT

You found a real bug — the feature **is** implemented, but mistake patterns weren’t being saved in time for the summary page to see them.

What was going wrong

Your session stats (1 incorrect) come from in-memory state during practice. The **Practice Mistakes** button checks **saved mistake patterns** in local storage via `canStartMistakeReview()`.

When the last question finished the session, the app navigated to `/practice/summary` **before** persisting the final attempt and its mistake pattern. The summary page rendered with an empty mistake list, so the button stayed disabled even though you had 1 incorrect answer.

What we fixed

In `usePracticeSession`, attempts (including mistake patterns) are now saved **synchronously before navigation** when a session ends:

```262:291:math-practice-app/src/hooks/usePracticeSession.ts
useEffect(() => {
if (!state.shouldFinish) {
return;
}
persistPendingAttempts(
state.attempts,
savedAttemptIdsRef.current,
settings.masteryThreshold,
reportStorageError,
);
// ... then navigate to summary
```

How to verify

1. Refresh the app (dev server should hot-reload the fix).
2. Start a new regular practice session.
3. On at least one question, flip the card and click **“I Got It Wrong”**.
4. Finish the session.

Practice Mistakes should now be enabled on the summary page. You can also confirm on **Statistics** — the missed question should appear under “Frequently Missed.”

Reminder

Mistakes are recorded when you click **“I Got It Wrong”**, not just when you pick the wrong answer choice. Picking a wrong answer but clicking **“I Got It Right”** counts as correct and won’t create a mistake pattern. Your 80% / 1 incorrect stats suggest you did use “I Got It Wrong” — the timing bug was the issue, not your usage.

453. ASSISTANT

You were right — this was a bug, not missing functionality. I've applied a deeper fix.

Root cause

Mistake patterns were saved in a `useEffect` **after** React updated state. On the session summary page, the app checked storage **before** that effect ran, so it often saw zero saved mistakes even when your session showed 1 incorrect.

Fixes applied

1. **Immediate save on each answer** — When you click “I Got It Wrong” (or “I Got It Right”), the attempt and mistake pattern are saved **synchronously** in `recordResult`, not in a later effect.

2. **Summary page backfill** — The summary page now reads incorrect answers from the session you just finished and ensures those mistakes are saved to storage before enabling **Practice Mistakes**.

3. **Session restore** — If you refresh mid-session, previously missed questions are backfilled into mistake storage.

How to verify

1. **Hard refresh** the browser (`Cmd+Shift+R` on Mac) so you load the latest code.

2. Start a **new** regular practice session (not mistake review).

3. On at least one question: pick an answer → **Flip Card** → click **“I Got It Wrong”**.

4. Finish the session.

Practice Mistakes should now be enabled on the summary page. You can also check **Statistics** — the missed question should appear under “Frequently Missed.”

If it’s still disabled after a hard refresh and a new session, tell me whether anything shows on the Statistics page — that will narrow down whether it’s a storage issue in the browser.

464. ASSISTANT

Your screenshot helped pinpoint the bug. The session correctly showed **1 Incorrect**, but the summary page was still disabling **Practice Mistakes**.

What was wrong

There was a logic bug on the summary page. After syncing mistakes to storage, this line ran:

```javascript
setCanPracticeMistakes(canStartMistakeReview()); // storage only
```

That **overwrote** the enabled state and disabled the button whenever storage wasn't updated yet — even when the session clearly had `Incorrect: 1`.

What we fixed

The button now enables when **any** of these are true:

1. Saved mistake patterns exist in storage
2. The session's attempt list includes a self-reported wrong answer
3. **The session stats show `incorrect > 0`** (your case: 5 attempted, 4 correct, 1 incorrect)

That last check matches exactly what your screenshot shows.

Note on “Mistake Review: 0”

That stat is **not** the number of saved mistakes. It counts how many **mistake-review mode** questions you answered in that session. For regular practice it will stay **0** — that part is expected.

Try again

1. Hard refresh once more (`Cmd+Shift+R`)

2. Complete a **new** practice session with at least one **“I Got It Wrong”**

3. On the summary page, **Practice Mistakes** should now be an active link (not greyed out)

If it’s still disabled after this refresh, check whether a yellow **storage warning** banner appears at the top of the page — that would mean the browser isn’t saving data locally.

474. ASSISTANT

The issue wasn’t the fix failing — you were on a **stale dev server**.

Your screenshot used **`http://localhost:5177`**. That port was still running an **old Vite instance** with the original bug:

```javascript
const canPracticeMistakes = canStartMistakeReview(); // old code — ignores session incorrect count
```

```

Meanwhile, the updated dev server had moved to **5178** (and now **5173**) with the fix. Hard refresh on 5177 only reloads old code from that zombie process.

### What to do

1. **Close all tabs** for `localhost:5173`–`5178`
2. Open **`http://localhost:5173/`** (fresh dev server with the fix)
3. Run through practice again: miss at least one question with **"I Got It Wrong"**, then finish the session

With **Incorrect: 1**, **Practice Mistakes** should be an active coral link, not greyed out.

### What we changed to prevent this

- Stopped orphaned Vite servers on ports 5173–5177
- Restarted dev on **port 5173** with `strictPort: true` so it won't silently jump to another port
- Simplified the summary page so the button state is computed directly from session stats (no async state flip)

If anything still looks wrong on **5173** after a new session, say so — at that point we'd dig into browser storage next.

[REDACTED]

## 475. USER

<user_query>Briefly inform the user about the task result and perform any follow-up actions (if needed). If there's no follow-ups needed, don't explicitly say that.</user_query>

## 476. ASSISTANT

[REDACTED]

TOOL CALL: Read {"path": "/Users/wei.wei/.cursor/projects/Users-wei-wei-Dropbox-math-practice/terminals/82326.txt"}

## 477. ASSISTANT

The dev server check passed: Vite started cleanly on **http://localhost:5173/** under Node 18.

Use that URL (not 5177 or other ports) when testing **Practice Mistakes** — those older ports were serving stale code without the fix. If the app isn't loading, run `npm run dev` from the project root again.

[REDACTED]

## 478. USER

<timestamp>Wednesday, Jul 29, 2026, 7:31 PM (UTC-4)</timestamp>

<user_query>

The bug is fixed.

</user_query>

## 479. ASSISTANT

Good to hear it's working.

The root cause was a combination of the summary page checking storage too early and a stale dev server on port 5177 serving old code. The fix saves mistakes when you answer, enables **Practice Mistakes** when the session shows incorrect answers, and the dev server is pinned to **http://localhost:5173/** so you don't hit outdated builds again.

TOOL CALL: TodoWrite {"merge": true, "todos": [{"id": "1", "content": "§83: Memoize statistics + reduce unnecessary re-renders", "status": "completed"}, {"id": "2", "content": "§84: Storage measurement, trim tests, aggregate archiving", "status": "completed"}, {"id": "3", "content": "§85: Lazy routes, fonts, bundle script, cleanup", "status": "completed"}, {"id": "4", "content": "Run tests/build and check off Phase 21 in TODO.md", "status": "completed"}]}

511. ASSISTANT

Phase 21 is implemented and all items in `TODO.md` are checked off. Summary:

§83 — Optimize React Rendering

- **`useStatistics`** memoizes statistics, mistake stats, and session lists with `useMemo` (keyed on `refreshKey` + `masteryThreshold`).

- **`StorageAlertProvider`** splits storage warnings from settings so dismissing a warning does not re-render practice pages.

- **`PracticeSetupPage`** loads active mistake count on mount instead of on every render.

§84 — Manage Large Practice Histories

- **Attempt archiving**: when stored attempts exceed 5,000, dropped attempts are merged into `mathPractice.statistics` via `statisticsArchiveService`.

- **`loadCombinedAppStatistics()`** returns archived + recent totals for the statistics UI.

- **`measurePracticeStorageUsage()`** reports byte usage per storage key.

- **`MAX_DISPLAYED_RECENT_SESSIONS = 20`** limits the recent sessions list.

- Tests cover 6,000-attempt trim/archive, storage measurement, and 5,000-attempt stats performance (<100ms).

§85 — Improve Loading Performance

- **Lazy-loaded** `StatisticsPage` and `SettingsPage` with `<Suspense>` + `PageLoading` fallback.

- **`npm run build:size`** script for bundle measurement.

- Removed unused **`public/vite.svg`**.

- Reduced Google Font weights (dropped 700 variants).

Results

- **224 tests passing**

- **Build succeeds** with code-split chunks:

- Main bundle: **321 kB** (98 kB gzip) — down from ~334 kB monolith

- Statistics chunk: **13 kB** (lazy)

- Settings chunk: **4 kB** (lazy)

TOOL CALL: Write {"path": "/Users/wei.wei/Dropbox/math-practice/math-practice-app/PRIVACY.md", "contents": "# Privacy Policy\n\nMath Practice is a browser-based learning app for children ages 7–12. This document describes how the app handles data in the initial release.\n\n## Summary\n\n- No personal information is collected.\n- All practice data stays in the browser on the user's device.\n- No third-party analytics or advertising trackers are used.\n- The child-facing interface does not include advertisements.\n- Clearing browser data removes saved progress.\n\n## Data Stored Locally\n\nThe app saves the following items in browser local storage only:\n\n- Application settings (sound, animations, default practice options)\n- Completed practice sessions\n- Individual question attempts\n- Mistake patterns for personalized review\n- Aggregate statistics derived from older attempts\n- An in-progress session snapshot, when applicable\n\nThis data is not transmitted to Math Practice servers because the initial release does not use accounts or cloud sync.\n\n## Data Not Collected\n\nThe app does not collect or request:\n\n- Names or contact information\n- User accounts or passwords\n- Location data\n- Device identifiers for tracking\n- Audio, video, or photos\n\n## Third-Party Services\n\nThe app loads web fonts from Google Fonts to improve readability. Font files are requested by the browser directly from Google; no practice history is shared with Google through the app.\n\nThe app does not embed analytics scripts, advertising networks, or social media widgets.\n\n## Removing Data\n\nProgress can be removed in two ways:\n\n1. **In the app:** open Settings and choose **Clear All Application Data**.\n2. **In the browser:** clear site data, cookies, or local storage for the Mat

h Practice site, or use private browsing without saving data.\n\nEither action permanently removes saved settings, sessions, attempts, statistics, and mistake patterns on that device.\n\n## Children\n\nThe practice interface is designed without advertisements or external links that would take children away from learning activities.\n\nIf accounts or cloud storage are added in a future version, this policy will be updated before those features launch.\n"}

TOOL CALL: Write {"contents": "# Deployment Guide\n\nMath Practice is a static single-page application built with Vite and React Router. Deploy the contents of `dist/` to any static host that supports SPA fallback routing.\n\n## Recommended Hosts\n\n| Service | Config file | Notes |\n|---------|-------------|-------|\n| [Netlify](https://www.netlify.com/) | `netlify.toml` | Connect the repo and set base directory to `math-practice-app`. |\n| [Vercel](https://vercel.com/) | `vercel.json` | Set root directory to `math-practice-app`. |\n| [Cloudflare Pages](https://pages.cloudflare.com/) | `public/_redirects` | Build command: `npm run build`, output: `dist`. |\n\nAll three configs rewrite unknown paths to `index.html` so deep links such as `/statistics` work after refresh.\n\n## Build and Verify Locally\n\nFrom `math-practice-app/`:\n\n```bash\nnpm run verify\nnpm run preview:verify\n```\n\n`npm run verify` runs formatting checks, linting, tests, and a production build.\n\n`npm run preview:verify` builds the app, starts `vite preview`, and checks that primary routes return the app shell.\n\n## Deploy to Netlify\n\n1. Push the repository to GitHub.\n2. Create a new Netlify site from the repository.\n3. Set **Base directory** to `math-practice-app`.\n4. Use build command `npm run build` and publish directory `dist`.\n5. Deploy and open the site URL.\n\n## Deploy to Vercel\n\n1. Import the repository in Vercel.\n2. Set **Root Directory** to `math-practice-app`.\n3. Accept the default install/build settings (`npm run build`, output `dist`).\n4. Deploy.\n\n## Post-Deploy Verification\n\nAfter deployment, confirm:\n\n1. **Routes:** `/`, `/practice/setup`, `/statistics`, `/settings`, and an unknown path such as `/missing`.\n2. **Local storage:** complete a short practice session

, refresh the page, and confirm statistics persist.\n3. **Responsive layout:** resize to phone and tablet widths; navigation and cards remain usable.\n4. **Console:** open developer tools and confirm no runtime errors during normal use.\n5. **Privacy:** open Settings and review the Privacy section.\n\n## Browser Testing Checklist\n\nRun these checks on each target browser before calling a release complete:\n\n### Desktop browsers\n\n- [ ] Google Chrome (latest)\n- [ ] Safari (latest)\n- [ ] Mozilla Firefox (latest)\n- [ ] Microsoft Edge (latest)\n\n### Tablet and mobile\n\n- [ ] iPad Safari or tablet emulator (~768px–1024px width)\n- [ ] Mobile Safari or Chrome on a phone (~320px–430px width)\n\n### Scenarios to test in each browser\n\n1. Start a regular practice session and finish it.\n2. Open Statistics and Settings.\n3. Refresh the page on `/statistics` and confirm the route still loads.\n4. Toggle a setting and confirm it persists after reload.\n5. Use browser back/forward navigation between Home, Practice Setup, and Statistics.\n6. Confirm the Privacy section appears in Settings.\n7. Confirm no advertisements or unrelated external links appear during practice.\n\nRecord the browser, device width, date, and tester initials beside each checklist item in your release notes.\n\n## Privacy Review Checklist\n\nBefore release, confirm:\n\n- [ ] No personal information is requested anywhere in the app.\n- [ ] Practice data is stored only in browser local storage.\n- [ ] No analytics or advertising scripts are included.\n- [ ] The child-facing UI contains no ads.\n- [ ] Settings explains that clearing browser data removes progress.\n\nSee [PRIVACY.md](./PRIVACY.md) for the full privacy statement.\n", "path": "/Users/wei.wei/Dropbox/math-practice/math-practice-app/DEPLOYMENT

.md"}

/Users/wei.wei/Dropbox/math-practice/TODO.md"}

TOOL CALL: TodoWrite {"merge": true, "todos": [{"content": "§86: Privacy notice UI + PRIVACY.md", "id": "1", "status": "completed"}, {"content": "§87–88: Deploy config, verify script, route smoke tests", "id": "2", "status": "completed"}, {"content": "§89: Deployment docs + run verify/build", "id": "3", "status": "completed"}, {"content": "Check off Phase 22 in TODO.md", "id": "4", "status": "completed"}]}

532. ASSISTANT

Phase 22 is implemented and all Phase 22 items in `TODO.md` are checked off.

§86 — Privacy Review

- Added a **Privacy** section on the Settings page (`PrivacyNotice` component).
- Added `PRIVACY.md` and `src/constants/privacyPolicy.ts`.
- Confirmed the app has no analytics, ads, or tracking scripts (only Google Fonts).
- Updated the clear-data note to mention browser site data.

§87 — Browser Testing

- Added automated **route smoke tests** in `src/release/releaseRouteSmoke.test.tsx` (7 routes).
- Added a **browser testing checklist** in `DEPLOYMENT.md` (Chrome, Safari, Firefox, Edge, tablet, mobile).

§88 — Production Build

- Added `npm run verify` (format check → lint → test → build).
- Added `npm run preview:verify` to build and curl-test SPA routes locally.
- Fixed lint issues (split `createAppRouter` out of `AppRoutes.tsx`).
- Ran formatting across the project for release readiness.
- Added SPA routing configs: `netlify.toml`, `vercel.json`, `public/_redirects`.
- Added GitHub Actions CI (`.github/workflows/ci.yml`).

§89 — Deploy

- Documented **Netlify, Vercel, and Cloudflare Pages** in `DEPLOYMENT.md`.
- Added post-deploy verification steps (routes, localStorage, responsive layout, console).
- Verified production build locally — **237 tests passing**, build succeeds, **7 routes verified** via preview.

Release commands

```bash
cd math-practice-app
npm run verify
npm run preview:verify
```

To publish to a public URL, connect the repo to Netlify or Vercel with base/root directory `math-practice-app` — configs are already in place. See math-practice-app/DEPLOYMENT.md for step-by-step instructions.

547. ASSISTANT

You were hitting a real bug. After the last question, the practice page returned **nothing** (`return null`) while waiting for a redirect that ran in a `useEffect` — so you could get stuck on a blank `/practice/session` page instead of seeing the summary.

What changed

1. **Session data is saved in `useLayoutEffect`** (before the browser paints), then a `summaryRedirect` state is set.

2. **`PracticePage` uses `<Navigate>`** to go to `/practice/summary` with the session stats once saving is done.

3. **While redirecting**, it shows “Preparing your session summary…” instead of a blank page.

After finishing a session, you should now land on the **Session Complete!** page with Attempted, Correct, Incorrect, and Accuracy.

Refresh at `http://localhost:5173` and run through another 5-question session to confirm. If the dev server isn’t running, start it with `npm run dev` from `math-practice-app/`.

>
> TOOL CALL: Grep {"path": "/Users/wei.wei/Dropbox/math-practice/specification.md", "pattern": "sound|explanation|animation|feedback", "-i": true}

554. ASSISTANT

Here's how the Settings preferences break down:

Implemented and working

| Setting | What it does |

|--------|----------------|

| **Card animation** | Controls the flip animation on question cards. When off (or when the OS prefers reduced motion), the card still flips but without animation. |

| **Encouraging feedback messages** | After you mark an answer right or wrong, short messages like “Great job!” or “Keep practicing!” appear on the back of the card. |

| **Mastery threshold** | Sets how many correct similar answers are needed to master a mistake pattern. Used in mistake review and shown in Statistics. |

| **Practice defaults** (below Preferences) | Default operations, difficulty, and session length are saved and used when you open Practice Setup. |

Saved in Settings, but not wired up yet

| Setting | Current behavior |

|--------|------------------|

| **Sound effects** | The toggle saves to local storage, but nothing in the app reads it. There are no sound files and no audio playback during practice. |

| **Show explanations** | The toggle saves, but nothing uses it. The card back shows the solved equation and your answer, not extra math explanations. |

So the screenshot shows real UI for all of those options, but **sound effects** and **show explanations** are placeholders for now — toggling them changes saved settings only, not what you see or hear during practice.

If you want, I can implement sound effects and/or explanations next.

TOOL CALL: ReadLints {"paths": ["/Users/wei.wei/Dropbox/math-practice/math-practice-app/src/components/practice/QuestionCard.tsx", "/Users/wei.wei/Dropbox/math-practice/math-practice-app/src/services/soundEffectsService.ts"]}

568. ASSISTANT

Both settings are now wired up during practice.

Sound effects

When **Sound effects** is on in Settings:

- A short click plays when you **flip the card**

- A positive two-tone chime plays when you tap **I Got It Right**

- A gentle low tone plays when you tap **I Got It Wrong**

Sounds are generated with the Web Audio API (no audio files), and only play in response to your clicks, so browser autoplay rules are respected.

Show explanations

When **Show explanations** is on, the back of the card shows a brief hint after you flip, for example:

- Addition: “Add 2 and 3 together to get 5.”

- Multiplication: “7 groups of 8 make 56.”

- Division: “Split 56 into groups of 8 to get 7 in each group.”

When the setting is off, the card back looks the same as before (no explanation block).

Try it at `http://localhost:5173`: confirm both toggles are on in Settings, start a practice session, pick an answer, flip the card, and you should hear sounds and see the explanation. Turn either setting off in Settings to verify it stops.

574. ASSISTANT

The “I Got It Wrong” sound was hard to hear for two reasons:

1. **Too quiet and low** — it was a single 220 Hz tone, which many speakers barely reproduce.

2. **Audio context timing** — the browser audio context wasn’t always resumed before playback, and the next question loaded immediately after the tap.

Fixes

- **Incorrect sound** is now a clearer two-note descending tone (similar to the correct chime, but lower and gentle).

- **Audio context** is properly resumed with `await` before any sound plays.

- **Brief delay (160ms)** before advancing to the next question so the sound can start.

Refresh the app, make sure **Sound effects** is on in Settings, then try flipping a card and tapping **I Got It Wrong** — you should hear a soft descending two-note tone. If you still don’t hear anything, check that your system/browser volume

isn’t muted and that the flip sound works (that confirms sound effects are enabled).

578. ASSISTANT

Yes — **Encouraging feedback messages** is implemented and wired up.

When the setting is **on** (default), after you flip the card and tap **I Got It Right** or **I Got It Wrong**, a short message appears on the back of the card:

- **Correct:** e.g. “Great job!”, “Nice work!”, “Keep it up!”

- **Incorrect:** e.g. “Keep practicing!”, “Good effort — try again!”, “Stick with it!”

The flow is:

1. Settings saves `feedbackMessagesEnabled`

2. `PracticePage` passes it to `QuestionCard`

3. On result, `getPracticeFeedbackMessage()` picks a random message

4. `PracticeFeedback` displays it on the card back (and it’s announced for screen readers)

When the setting is **off**, those messages are not shown.

Note: If **Sound effects** is also on, the card advances after ~160ms, so the message may only flash briefly before the next question. With sound effects off, you’ll see it a bit longer on the card back.

587. ASSISTANT

The feedback was disappearing because the app moved to the next question almost immediately — only **160ms** when sound effects were on, and **instantly** when they were off.

Fix

When **Encouraging feedback messages** is enabled, the card now stays on the back for **1.5 seconds** before advancing, so you have time to read the message.

- **Feedback on + sound on:** 1.5s pause (covers the sound too)

- **Feedback off + sound on:** 400ms pause (enough for the tone)

- **Both off:** advances immediately, as before

Refresh and try another question — you should see messages like “Great job!” or “Keep practicing!” on the card back for about a second and a half before the next one appears.

602. ASSISTANT

The remote is configured, but the push did not complete from this environment because GitHub authentication is not available here (no `gh` CLI, no SSH keys, and HTTPS cannot prompt for credentials interactively).

Already done:

- `origin` → `https://github.com/weiwei1-ai/math-practice.git`

- Branch `main` has 2 commits ready to push (including `c45ea6e`)

Run this in your terminal to push:

```bash

cd /Users/wei.wei/Dropbox/math-practice

git push -u origin main

```

macOS should use the Keychain credential helper and prompt you to sign in to GitHub if needed.

If HTTPS auth fails, use a Personal Access Token:

1. GitHub → Settings → Developer settings → Personal access tokens

2. Create a token with `repo` scope

3. When prompted for a password during push, paste the token

Or use SSH (if you prefer):

```bash

git remote set-url origin git@github.com:weiwei1-ai/math-practice.git

git push -u origin main

```

That requires an SSH key added to your GitHub account. If you run the push locally and hit an error, paste the output and I can help troubleshoot.

> TOOL CALL: Read {"path": "/Users/wei.wei/Dropbox/math-practice/math-practice-app/netlify.toml"}

605. ASSISTANT

Here's a practical deployment path for this project.

Before you deploy

This is a **static React SPA** — no backend server. All data stays in the browser (local storage). Deployment = build the app and host the `dist/` folder with SPA routing support.

1. Push to GitHub (if you haven't yet):

```bash

cd /Users/wei.wei/Dropbox/math-practice

git push -u origin main

```

2. Verify locally (optional but recommended):

```bash

cd math-practice-app
```

npm run verify

npm run preview:verify

```

---

## Easiest options (already configured)

Your repo includes configs for three hosts. Pick one:

### Option A: Netlify (good default)

1. Go to [netlify.com](https://www.netlify.com/) and sign in with GitHub.
2. **Add new site** → **Import from Git** → select `weiwei1-ai/math-practice`.
3. Set:
- **Base directory:** `math-practice-app`
- **Build command:** `npm run build`
- **Publish directory:** `dist`
4. Deploy.

`netlify.toml` already handles SPA routing (so `/statistics` works on refresh).

### Option B: Vercel

1. Go to [vercel.com](https://vercel.com/) and import the GitHub repo.
2. Set **Root Directory** to `math-practice-app`.
3. Build command: `npm run build`, output: `dist`.
4. Deploy.

`vercel.json` handles routing.

### Option C: Cloudflare Pages

1. Connect the repo in Cloudflare Pages.
2. Root: `math-practice-app`, build: `npm run build`, output: `dist`.
3. `public/_redirects` handles SPA fallback.

---

## Important repo detail

The app lives in **`math-practice-app/`**, not the repo root. On any host, point the build to that subdirectory — otherwise the build will fail.

---

## After deploy — quick checks

1. Open `/`, `/practice/setup`, `/statistics`, `/settings`.
2. Refresh on `/statistics` — page should still load (not 404).
3. Complete a short practice session, refresh — stats should persist.
4. Open Settings → confirm the Privacy section appears.
5. Check the browser console for errors.

Full checklist: [math-practice-app/DEPLOYMENT.md](math-practice-app/DEPLOYMENT.md).
```

What you don't need

- No database or API keys

- No environment variables for the initial release

- No server-side code — free tiers on Netlify/Vercel/Cloudflare are enough

---

If you want help with a specific host

Tell me which one (Netlify, Vercel, or Cloudflare Pages) and I can walk through that flow step by step. If you want me to run commands or change config, switch to **Agent mode**.

TOOL CALL: Read {"path": "/Users/wei.wei/Dropbox/math-practice/math-practice-app/dist/index.html"}

TOOL CALL: Read {"path": "/Users/wei.wei/Dropbox/math-practice/math-practice-app/package.json", "limit": 20}

609. ASSISTANT

The Netlify "Page not found" screen almost always means **the site wasn't built/deployed correctly**, or **SPA routing isn't configured**. Your app is a React single-page app, so both matter.

Most likely cause: wrong Netlify build settings

The app lives in **`math-practice-app/`**, not the repo root. If Netlify is pointed at the wrong folder, it may deploy nothing useful (or no `index.html`).

Correct Netlify settings

In **Site configuration → Build & deploy → Build settings**:

| Setting | Value |

|--------|--------|

| **Base directory** | `math-practice-app` |

| **Build command** | `npm run build` |

| **Publish directory** | `dist` |

Important: with base directory set to `math-practice-app`, publish directory is **`dist`** (not `math-practice-app/dist`).

Then trigger **Deploy site → Clear cache and deploy site**.

Step 1: Check the deploy log

In Netlify: **Deploys** → latest deploy → **View deploy log**.

Look for:

- **Build failed** (TypeScript, missing dependencies, etc.)

- **“Publish directory does not contain index.html”**

- Build succeeded but published the wrong folder

If build failed, fix that first — a failed deploy often shows Netlify’s 404 page.

Step 2: Which URL shows the 404?

A) Homepage (`https://your-site.netlify.app/`) → 404

→ Usually wrong publish directory or build didn’t produce `dist/index.html`.

B) Homepage works, but `/statistics` or `/practice/setup` → 404 on refresh

→ SPA redirect rules aren’t applied.

Your repo already includes SPA routing in two places:

- `math-practice-app/netlify.toml` (redirects `/*` → `/index.html`)

- `math-practice-app/public/_redirects` (copied into `dist/` on build)

Those only apply if **base directory is `math-practice-app`**, so Netlify picks up `netlify.toml`.

Alternative: build from repo root

If you prefer **no** base directory (repo root):

| Setting | Value |

|--------|--------|

| **Base directory** | *(leave empty)* |

| **Build command** | `npm run build` |

| **Publish directory** | `math-practice-app/dist` |

Root `package.json` delegates build to `math-practice-app`. Netlify must run `npm install` in a way that installs app dependencies (often you still want base directory `math-practice-app` — it’s simpler).

Step 3: Verify after redeploy

1. Open `https://your-site.netlify.app/` — should show the Math Practice home page.

2. Open `/statistics` directly in the address bar — should load, not 404.

3. Complete a quick practice session — data should persist after refresh (local storage).

Quick checklist

- [ ] Base directory = `math-practice-app`

- [ ] Publish directory = `dist`

- [ ] Latest deploy log shows **Published** with files like `index.html`, `assets/...`

- [ ] Clear cache and redeploy after changing settings

If you share:

1. Your exact Netlify build settings (base, build command, publish directory), and

2. Whether the homepage or only subpaths 404,

I can narrow it down further. If you want me to add a root-level `netlify.toml` or adjust config in the repo, switch to **Agent mode** and I can do that for you.

9:36:31 PM: Section completed: cleanup

9:36:31 PM: Finished processing build request in 4.867s

</user_query>

611. ASSISTANT

Your log shows exactly what went wrong: **Netlify never built or deployed the app.**

What the log means

| Log line | Problem |

|---|---|

| `No build steps found, continuing to publishing` | No build command ran — Vite never ran |

| `Starting to deploy site from '/'` | It published from the **repo root**, not `math-practice-app/` |

| `0 new file(s) to upload` | **Nothing** was deployed (no `index.html`, no assets) |

| `up to date in 434ms` | Only the root `package.json` was checked; it has no app dependencies |

So Netlify put up an empty site → you get Netlify's generic **"Page not found"**.

Fix in Netlify

Go to **Site configuration → Build & deploy → Build settings → Edit settings** and set:

| Setting | Value |

|---|---|

| **Base directory** | `math-practice-app` |

| **Build command** | `npm run build` |

| **Publish directory** | `dist` |

Save, then **Deploys → Trigger deploy → Clear cache and deploy site**.

What a successful deploy should look like

You should see something like:

- `npm run build` (or `tsc -b && vite build`)
- Many files uploaded (`index.html`, `assets/...`, `_redirects`, etc.)
- **Not** `0 new file(s) to upload`
- **Not** `No build steps found`

Why this works

- **`math-practice-app/`** is where `package.json`, source, and `netlify.toml` live.
- **`npm run build`** produces the `dist/` folder with your app.
- **`dist`** is what Netlify should serve.
- **`netlify.toml`** in that folder sets SPA redirects so routes like `/statistics` work on refresh.

Optional: build from repo root

If you leave base directory empty:

- **Build command:** `cd math-practice-app && npm install && npm run build`
- **Publish directory:** `math-practice-app/dist`

Using **base directory = `math-practice-app`** is simpler and matches [DEPLOYMENT.md](math-practice-app/DEPLOYMENT.md).

After redeploying, open your site URL — you should see the Math Practice home page. If the build log still shows `0 new file(s) to upload`, paste the new log and we can dig further.

[REDACTED]

612. USER

<user_query>Briefly inform the user about the task result and perform any follow-up actions (if needed). If there's no follow-ups needed, don't explicitly say that.</user_query>

613. ASSISTANT

[REDACTED]

TOOL CALL: Read {"path": "/Users/wei.wei/.cursor/projects/Users-wei-wei-Dropbox-math-practice/terminals/82329.txt"}

614. ASSISTANT

The dev server **did start successfully** at **http://localhost:5173/** and ran for a long session before it was stopped.

While it was running, there was a brief error when `AppLayout.tsx` had a wrong import path for `PageLoading` — that was fixed during the session, and Vite hot-reloaded the rest of the changes normally.

If you want to work locally again, start it with:

```bash
cd /Users/wei.wei/Dropbox/math-practice
npm run dev
```

</user_query>

616. USER

<available_subagent_types>

Available subagent_types and a quick description of what they do:

- generalPurpose: General-purpose agent for researching complex questions, searching for code, and executing multi-step tasks. Use when searching for a keyword or file and not confident you'll find the match quickly.

- explore: Fast agent specialized for exploring codebases. Use this when you need to quickly find files by patterns (eg. " src/components/**/*.tsx"), search code for keywords (eg. "API endpoints"), or answer questions about the codebase (eg. " how do API endpoints work?"). When calling this agent, specify the desired thoroughness level: "quick" for basic searches, " medium" for moderate exploration, or "very thorough" for comprehensive analysis across multiple locations and naming conventions.

- cursor-guide: Read Cursor product documentation to answer questions about how Cursor Desktop, IDE, CLI, Cloud Agents, Bugbot, and other features work. Use when the user asks 'In Cursor, how do I...?' or similar questions about Cursor products.

- ci-investigator: Investigate a single failing PR CI check and return a short root-cause summary. Use when the user asks to summarize, explain, diagnose, or investigate a specific failed check from a pull request.

- bugbot: Use only when the user *explicitly* asks for a Bugbot-like review of local code changes. When launching this subagent, set the Task description to exactly "Bugbot". Launch exactly one Bugbot subagent with `run_in_background: false` unless the user explicitly asks to run in background. Use this fixed prompt form: "Full Repository Path: ...\nDiff: <one of: \"branch changes\", \"uncommitted changes\", \"natural language\">\nChange Description: ...\nCustom Instructions: ..."; default to `Diff: branch changes`; include `Change Description` only when `Diff` is `natural language`, formatting it as one block per changed file (a `<path> (added|modified|deleted|renamed)` header followed by bullets of what changed, mentioning line numbers or ranges inline where helpful), and only use `natural language` as a last resort after a regular diff-based review failed because the diff could not be computed; include `Custom Instructions` only when the user gave specific review instructions. This subagent is single-shot and does not support `resume`; always launch a fresh subagent instead.

- security-review: Use only when the user *explicitly* asks for a security review of local code changes. When launching this subagent, set the Task description to exactly "Security Review". Launch exactly one security-review subagent with `run_in_background: false` unless the user explicitly asks to run in background. Use this fixed prompt form: "Full Repository Path: ...\nDiff: <one of: \"branch changes\", \"uncommitted changes\">\nCustom Instructions: ..."; default to `Diff: branch changes`; include `Custom Instructions` only when the user gave specific review instructions. This subagent is single-shot and does not support `resume`; always launch a fresh subagent instead.

- best-of-n-runner: Run a task in an isolated git worktree. Each best-of-n-runner gets its own branch and working directory. Use for best-of-N parallel attempts or isolated experiments.

</available_subagent_types>

<available_subagent_models>

If the user explicitly asks for the model of a subagent/task, you may ONLY use model slugs from this list:

- inherit (default; required unless the user explicitly requested another model)
- claude-fable-5-1-thinking-high
- claude-opus-5-5-medium
- claude-sonnet-5-5-high
- composer-2.5-fast
- cursor-grok-4.6-high-fast
- gemini-3.8-flash-high
- gpt-5.6-sol-medium
- grok-4.7-high-fast
- muse-spark-1.3-high

If the user isn't asking for a specific version, prefer the latest version of the model family. As an example, if the user just says "gpt" or "claude", use the latest available version of GPT or Claude.

IMPORTANT: If the user requests a model that is NOT in the list above, do NOT substitute a different model or guess. Instead, skip launching the subagent with that model and tell the user which model was unavailable and which models are available.

When speaking to the USER about which model you selected for a subagent, do NOT use the kebab-case model names unless the user requested the model using that format. Ue the same naming scheme the user used to discuss the model when they requested it.

</available_subagent_models>

<dynamic_tools>

You have access to tools through dynamic namespaces, e.g. MCP servers, using `GetDynamicTools` and `CallDynamicTool`.

Dynamic Tool Discovery and Invocation

Use `GetDynamicTools` to discover tool schemas, then `CallDynamicTool` to invoke one tool. Aim to minimize round-trips: ideally one discovery call followed by one invocation.

If the user mentions a product or service represented by an available namespace, and the request likely depends on it, proactively inspect that namespace before answering. If you are unsure which namespace matches, search with a relevant pattern.

`GetDynamicTools` supports these modes:

1. `{"namespace":"<id>"}`: returns schemas and full descriptions for every tool in that namespace.
2. `{"namespace":"<id>","toolName":"<name>"}`: returns one tool schema with its full description.
3. `{"pattern":"<regex>"}`: searches namespace and tool names.
4. `{"namespace":"<id>","pattern":"<regex>"}`: searches tools within one namespace.
5. No arguments: returns the full catalog.

Pattern-search and catalog results shorten long descriptions, marked by a trailing "... [truncated]"; namespace and single-tool lookups always return the complete description.

Always inspect a tool's schema before invoking it with `CallDynamicTool`.

If the available dynamic tools do not fully support what the user asked you to do, complete the work you can with the current tool set. In your work summary, include what you were unable to do and why. Do not use browser automation to work around missing tools unless the user explicitly asks you to use the browser.

Available dynamic tool namespaces:

<dynamic_tool_namespaces>

<namespace name="cursor-app-control" tools="move_agent_to_root, move_agent_to_cloned_root, create_project, rename_chat, cursor_dialog, open_resource, open_automation, install_plugin" namespaceUseInstructions="Controls the Cursor application itself (workspace root, projects, opening resources, automations, and local task drafts, user rules, chat title). See each tool description for usage." source="mcp" />

<namespace name="cursor-ide-browser" tools="browser_navigate, browser_snapshot, browser_click, browser_mouse_click_xy, browser_type, browser_fill, browser_select_option, browser_press_key, browser_scroll, browser_drag, browser_get_bounding_box, browser_highlight, browser_tabs, browser_cdp, browser_take_screenshot, browser_lock" namespaceUseInstructions="The cursor-ide-browser MCP server provides a Cursor-owned browser tab plus a raw Chrome DevTools Protocol command tool.

CORE WORKFLOW:

1. Start by understanding the user's goal and what success looks like on the page.

2. Use browser_tabs with action "list" to inspect open tabs and URLs before acting.

3. Use browser_navigate to create or navigate the target tab. Omit the position parameter for background automation so focus is preserved.

4. Use browser_lock before longer automation on an existing tab, then browser_lock with action "unlock" when finished.

5. Use browser_snapshot for accessibility context and browser_take_screenshot for visual verification.

6. Use browser_click, browser_type, browser_fill, browser_select_option, browser_press_key, browser_scroll, and browser_drag for page interactions.

7. Use browser_highlight and browser_get_bounding_box for visual grounding and coordinate diagnostics.

8. Use browser_cdp for page inspection, profiling, runtime evaluation, DOM/CSS queries, and performance data.

AVOID RABBIT HOLES:

1. Do not repeat the same failing action more than once without new evidence such as a fresh snapshot, a different ref, a changed page state, or a clear new hypothesis.

2. IMPORTANT: If four attempts fail or progress stalls, stop acting and report what you observed, what blocked progress, and the most likely next step.

3. Prefer gathering evidence over brute force. If the page is confusing, use browser_snapshot, browser_take_screenshot, or CDP inspection before trying more actions.

4. If you encounter a blocker such as login, passkey/manual user interaction, permissions, captchas, destructive confirmations, missing data, or an unexpected state, stop and report it instead of improvising repeated actions.

5. Do not get stuck in wait-action-wait loops. Every retry should be justified by something newly observed.

CRITICAL - Lock/unlock workflow:

1. browser_lock requires an existing browser tab - you CANNOT call browser_lock with action: "lock" before browser_navigate

2. Correct order: browser_navigate -> browser_lock({ action: "lock" }) -> (interactions) -> browser_lock({ action: "unlock" })

3. If a browser tab already exists (check with browser_tabs list), call browser_lock with action: "lock" FIRST before any interactions

4. Only call browser_lock with action: "unlock" when completely done with ALL browser operations for this turn

IMPORTANT - Waiting strategy:

When waiting for page changes, prefer short CDP polling loops with Runtime.evaluate, DOM queries, Page lifecycle signals, or browser_snapshot checks rather than a single long wait.

CDP USAGE:

- Use browser_cdp with a DevTools Protocol method and params object, for example Runtime.evaluate, DOM.getDocument, CSS.getComputedStyleForNode, Profiler.start/stop, Performance.getMetrics, Log.enable, and Network.enable.

- Do not use browser_cdp with CDP Input.* methods. They are denied because they are focus-sensitive in Electron webviews and can route input to Cursor UI instead of the browser page.

- Use browser_click, browser_type, browser_fill, browser_select_option, browser_press_key, browser_scroll, and browser_drag for clicks, typing, filling inputs, selecting options, keyboard actions, scrolling, and drag-and-drop.

- Use Runtime.evaluate for advanced DOM-scoped interactions that the dedicated browser tools do not cover.

- For profiling, call Profiler.enable, Profiler.start, reproduce the behavior, then Profiler.stop. The profile is saved to a file and returned as a log_file; read that file only when you need to inspect details.

- For JavaScript evaluation, prefer Runtime.evaluate with returnByValue when possible.

- Some browser-wide or sensitive CDP methods are denied, especially cookie, storage, permission, download, target-management, filesystem-backed file-input commands, system-level commands, and CDP navigation/history navigation commands.

- Large CDP responses are saved to files instead of being inlined. Prefer using the returned file path over immediately stuffing large payloads into context; read focused sections only when needed.

VISION:

- browser_take_screenshot attaches an image result that the model can inspect. CDP Page.captureScreenshot returns data inside JSON and should not replace browser_take_screenshot when visual verification is needed.

NOTES:

- browser_snapshot returns snapshot YAML and is the main source of truth for page structure.

- Refs are opaque handles tied to the latest browser_snapshot for that tab.

- Iframe content is not accessible - only elements outside iframes can be interacted with.

- When you stop to report a blocker, include the current page, the target you were trying to reach, the blocker you observed, and the best next action. If the blocker requires manual user interaction, ask the user to take over at that point rather than assuming it in advance." source="mcp" />

<namespace name="cursor" tools="Await, CreateGoal, Delete, EditNotebook, FetchMcpResource, GenerateImage, ReadLints, SearchConversations, SetActiveBranch, Task, TodoWrite, UpdateGoal, WebFetch, WebSearch" namespaceUseInstructions="Native Cursor tools for this session. These are highly recommended and useful tools that you should use when the right situation arises. Don't be afraid to look at one if it seems relevant, even if you don't end up using it. You MUST read the tool schemas before calling them.

Here are some crucial instructions:

- Await: Use to sleep and check shell progress. Never sleep using shell.

- Task: Spawn local and cloud subagents natively.

- TodoWrite: Use this tool to manage complex multi-step tasks." source="cursor" />

</dynamic_tool_namespaces>

If an MCP-backed namespace requires authentication, call `mcp_auth` through `CallDynamicTool` for that namespace, then inspect it again and retry if appropriate. Do not authenticate namespaces preemptively or repeatedly.

</dynamic_tools>

621. ASSISTANT

You have a few ways to save chats for **math-practice**, from quickest to most polished.

1. Copy from the chat UI (single thread)

Cursor does not always offer “export whole chat” in the panel. What usually works:

- Use **Copy** on individual assistant replies (often as Markdown).

- Select all in the thread and copy manually for a quick backup.

That is fine for one short chat; it is tedious for long Agent threads.

2. Agent transcript file (this project, on disk)

For **Agent** chats tied to this workspace, Cursor also keeps a local transcript. For the long thread you have been using, the main file is:

`/Users/wei.wei/.cursor/projects/Users-wei-wei-Dropbox-math-practice/agent-transcripts/728a2bb7-f640-496a-a0a4-de61963afca1/728a2bb7-f640-496a-a0a4-de61963afca1.jsonl`

You can **copy or duplicate that `.jsonl` file** anywhere you want (Dropbox, repo docs folder, etc.). Format is one JSON object per line (`user` / `assistant` messages). Some content may be summarized or redacted, and tool details may be stripped or abbreviated—it is an archive, not a pretty export.

There are also subagent transcripts under the same folder’s `subagents/` directory.

3. Export all chats for this workspace (recommended for Markdown)

Cursor stores most chat/Composer data locally in SQLite (`state.vscdb`) under:

`~/Library/Application Support/Cursor/User/workspaceStorage/`

There is **no built-in “export all project chats”** button; people typically use:

| Approach | What you get |

|----------|----------------|

| **[Cursor Chat Bulk Export](https://marketplace.visualstudio.com/items?itemName=AnasAbbasCode.cursor-chat-bulk-export)** extension | Open `math-practice` in Cursor → Command Palette → **Export Current Workspace Chats** → Markdown in `.cursor-chat-export/` |

| **`npx cursor-export`** ([npm](https://www.npmjs.com/package/cursor-export)) | Markdown / HTML / JSON from workspace storage |

| **[cursor-chat-export](https://github.com/cursor-export/cursor-chat-export)** (Python CLI) | Discover workspaces, export tabs to Markdown |

For your setup: open the folder **`/Users/wei.wei/Dropbox/math-practice`** (same root Cursor uses), run the export command, then pick the conversations you want.

4. Manual / advanced (SQLite)

The [Cursor forum guide](https://forum.cursor.com/t/guide-5-steps-exporting-chats-prompts-from-cursor/2825) walks through querying `state.vscdb` with Datasette. Useful if you want raw JSON and are comfortable with SQL.

Practical suggestion: For a readable backup of everything in this project, use **Cursor Chat Bulk Export** or **`cursor-export`**. For **this one Agent session** only, copying the **`.jsonl`** path above is the fastest.

If you tell me whether you want Markdown for reading or raw JSON for archiving, I can narrow this to one exact workflow (still in Ask mode—I cannot run the export for you).
